Amoxicillin is a type of penicillin antibiotic that works by interfering with the formation of bacterial cell walls, ultimately killing the bacteria and stopping the infection from spreading. It's used to treat a wide range of infections, including those affecting the ears, sinuses, lungs, and urinary tract.

The dosage of 500mg is typical for adults and older children. It is often taken every 8 or 12 hours, depending on the severity of the infection and the prescribing physician's instructions.

Pediatric dosing is usually weight-based and adjusted accordingly.
